Actual layer-compatible DAG from the final single-cluster placement

Numbers inside boxes are GPU IDs. Box position and width follow stored layer intervals. Pale arrows are additional cross-branch links; teal marks one real example.

Actual stitched transition at layer 24

What this means

24 GPUs, 80 model layers

2 designed complete suffixes

47 exported links; 21 cross-branch links

37,053 structural source-to-sink paths

G9 finishes at 24; G3 can continue to 26

Path count describes graph structure, not live queue or KV feasibility.

Source: single_final/placement.json + simulator_cluster.ini. S/T = source/sink; G# = placement GPU ID (simulator node ID = G# + 2). Intervals use [start, end).
